This analysis investigates the root causes behind the high number of returned orders at Superstore. The goal is to identify patterns and factors driving returns—such as product categories, shipping methods, regions, and customer segments—and provide actionable insights to help the CEO and leadership team reduce return rates and improve profitability.

Return Rate (percentage of orders returned) is best for comparing performance across categories, regions, or time periods.

Some of the key causes of returns is the shipping method, certain sub-categories, and what states they are being ordered in.

The analysis shows that returned orders are concentrated in specific product categories, shipping methods, and regions. By addressing issues such as product quality in high-return categories, optimizing shipping strategies, and focusing on at-risk customer segments, Superstore can significantly reduce return rates, improve customer satisfaction, and protect profitability.
